## Did you find the assignment brief clear?

I found the assignment brief clear and easy to understand. The explanation that this document should function as a living resource throughout the semester project made the purpose very evident. Having a well-structured plan will make it much easier to work effectively during the semester project.

## How did you approach this assignment?

I started by reading through the module content. After that, I watched videos/courses on LinkedIn Learning about agile and project management.

After getting an understanding of what I was supposed to do, I then reviewed all the material and work I did for the previous two assignments, and created tickets for everything I did for these, or thought I should have done. I made sure to make the tickets as generic as possible while also being specific about the work needed to be done.

## Additional Comments

I decided that the «Estimate» column should be in hours. Utilising this as a system, I have 141 hours of estimated work. Since 4 weeks full time equals 160 hours of work - including brakes, this means the estimated work load is almost exactly 4 weeks of work full time, but not above.

To keep time, i decided to also make, and print, an overview where I work 5 hours every day, including during the weekends. The hope is to stay below the red line, and if I am below I have two choices. 1 - work for better quality within the sprint and its tickets. I will not use this as an excuse to work faster. Or - 2 - rest. Sometimes, some days, it is better to rest, if the wish is to work better the next day(s). Do however wish to get at least one or two days ahead of my plan, so as to account for unexpected occurrences. It is a guesstimate, and it *is* possible to change tickets in the coming sprints - changing this timeline.
