# Naming conventions

In this project all files and folders will use snake-case.

HTML-class names will also use snake-case, and HTML-IDs will use camelCase (not PascalCase).

The word wrapper will be used in class-names for helper-divs or helper-sections that only serve in creating our layout structure.

The word card will be used in class-names to describe containers and some of its children - describing content. Content will be organised in into cards. We can have card-wrapper and also describe its size - large takes the full content width and therefore stand alone. Medium will share space with one other card and a small card can share line-space with multiple cards.

Example of a medium card

The card-size reflects its size on a normal desktop-screen. On phone-screens it will be sized down, and at some point all card-sizes might get the same width.

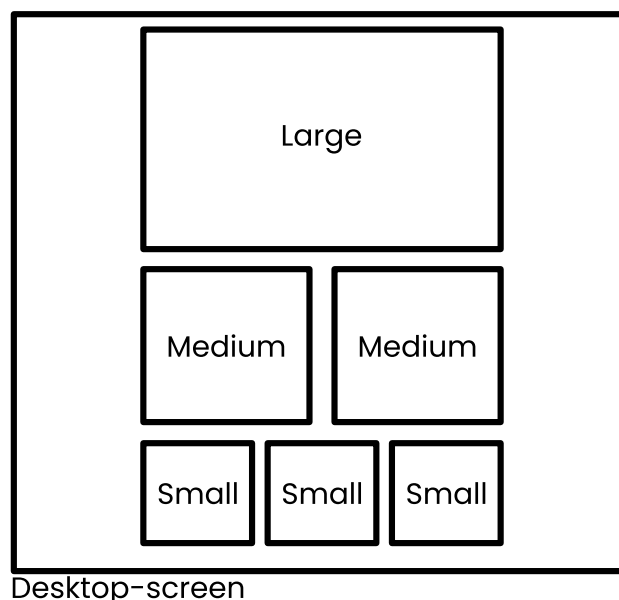

Desktop-screen

Image formats and image presentation

Header Images are cropped to a 1:4.233 format (for example 1905x450) and exported to webp-format with sizes ranging from 60 to 100 kB depending on original size and format.

Example of a header image

Other images should be a squircle-shape with n=3.

The Lamé curves/Squigonometry

Overview over squircles. At large n's, a squircle becomes a square, while at n→2+ becomes the unit circle.
